DOCKET NO. 2002.02.002.NS0 U.S. SERIAL NO. 10/038,878

IN THE CLAIMS

Please amend Claims 1-26 as follows:

1. (Currently Amended) A switch capable of handling call connections between calling devices and called devices on a plurality of trunk lines associated with said switch, said switch comprising:

a main processing unit capable of executing call process client applications, wherein each of said call process client applications is associated with one of said call connections; and

N call application nodes capable of executing call process server applications, wherein a first call process server application is executed on a first one of said N call application nodes and is associated with a similar second call process server application executed on a second one of said N call application nodes separate from said first call application node, said first and second call process server applications thereby forming a first load sharing group server application, wherein said each call process client application sends a call process service request to said first load sharing group server application selects one of said first and second call process server applications to perform said [requested] call process service request according to a load distribution algorithm.

2. (Original) The switch as set forth in Claim 1 wherein said load distribution algorithm distributes new call process services requests in an alternating manner between said first and second call process server applications.

- 3. (Original) The switch as set forth in Claim 1 wherein said load distribution algorithm distributes new call process service requests according to a current call process load of said first call process server application and a current call process load of said second call process server application.
- 4. (Original) The switch as set forth in Claim 3 wherein said load distribution algorithm distributes said new call process service requests in order to maintain said current call process load of said first call process server application at a level substantially equal to said current call process load of said second call process server application.
- 5. (Original) The switch as set forth in Claim 1 wherein said first call process server application comprises a first primary-backup group server application, wherein said first primary-backup group server application comprises a first primary call process executed on said first call application node and a first backup call process associated with said first primary call process.
- 6. (Original) The switch as set forth in Claim 5 wherein state information associated with said first primary call process is mirrored to said first backup call process associated with said first primary call process.

- 7. (Original) The switch as set forth in Claim 6 wherein said first backup call process resides on said first call application node.
- 8. (Original) The switch as set forth in Claim 6 wherein said first backup call process resides on a call application node separate from said first call application node.
- 9. (Original) The switch as set forth in Claim 1 wherein said second call process server application comprises a second primary-backup group server application, wherein said second primary-backup group server application comprises a second primary call process executed on said second call application node and a second backup call process associated with said second primary call process.
- 10. (Original) The switch as set forth in Claim 9 wherein state information associated with said second primary call process is mirrored to said second backup call process associated with said second primary call process.
- 11. (Original) The switch as set forth in Claim 10 wherein said second backup call process resides on said second call application node.

DOCKET NO. 2002.02.002.NS0 U.S. SERIAL NO. 10/038,878

12. (Original) The switch as set forth in Claim 10 wherein said second backup call process resides on a call application node separate from said second call application node.

13. (Currently Amended) A wireless network comprising:

a plurality of base stations capable of communicating with a plurality of mobile stations in a coverage are area of said wireless network; and

a mobile switching center coupled to said plurality of base stations and to a public switched telephone network by a plurality of trunk lines, wherein said mobile switching center is capable of handling call connections between calling devices and called devices on said plurality of trunk lines, said mobile switching center comprising:

a main processing unit capable of executing call process client applications, wherein each of said call process client applications is associated with one of said call connections; and

N call application nodes capable of executing call process server applications, wherein a first call process server application is executed on a first one of said N call application nodes and is associated with a similar second call process server application executed on a second one of said N call application nodes separate from said first call application node, said first and second call process server applications thereby forming a first load sharing group server application, wherein said each call process client application sends a call process service request to said first load sharing group server application and said first

DOCKET NO. 2002.02.002.NS0 U.S. SERIAL NO. 10/038,878

load sharing group server application selects one of said first and second call process server

applications to perform said [requested] call process service request according to a load

distribution algorithm.

14. (Original) The wireless network as set forth in Claim 13 wherein said load

distribution algorithm distributes new call process services requests in an alternating manner

between said first and second call process server applications.

15. (Original) The wireless network as set forth in Claim 13 wherein said load

distribution algorithm distributes new call process service requests according to a current call process

load of said first call process server application and a current call process load of said second call

process server application.

16. (Original) The wireless network as set forth in Claim 15 wherein said load

distribution algorithm distributes said new call process service requests in order to maintain said

current call process load of said first call process server application at a level substantially equal to

said current call process load of said second call process server application.

17. (Original) The wireless network as set forth in Claim 13 wherein said first call

process server application comprises a first primary-backup group server application, wherein said

first primary-backup group server application comprises a first primary call process executed on said first call application node and a first backup call process associated with said first primary call process.

- 18. (Original) The wireless network as set forth in Claim 17 wherein state information associated with said first primary call process is mirrored to said first backup call process associated with said first primary call process.
- 19. (Original) The wireless network as set forth in Claim 18 wherein said first backup call process resides on said first call application node.
- 20. (Original) The wireless network as set forth in Claim 18 wherein said first backup call process resides on a call application node separate from said first call application node.
- 21. (Original) The wireless network as set forth in Claim 13 wherein said second call process server application comprises a second primary-backup group server application, wherein said second primary-backup group server application comprises a second primary call process executed on said second call application node and a second backup call process associated with said second primary call process.
